

The Space-Time Energy Level Change Powered Christmas Tree Light-Sail Smorgasbord. Notes On Novel Light-Sail Propulsion Methods. Volume 33.

In this series of volumes, we present yet additional propulsion modes. These modes include ad hoc considerations for motive force acting on a spacecraft by virtue of somehow lowering the energy state of the space-time regions located in front of a Christmas Tree Light Sail spacecraft. Accordingly, a number of aspects of such mechanisms can be considered. For example, the electrodynamic structure of the vacuum region located immediately in front of the spacecraft might somehow be reduced in energy contents resulting in the pulling or flowing of the spacecraft forward into the space-time so depleted of electrodynamic space-time energy. Analogous mechanisms for depleting the space-time vacuum energy structure are plausible as well including the strong force and weak force energy structures. For G.U.T. unification forces, we consider lowering the Mirror Matter electromagnetic, strong, and weak force analogues. Note that herein, I am not simply referring to the reduction of the quantum vacuum flux but instead am referring to a lowering of the potential energy well of the portion of the universe that is located just in front of the spacecraft. Accordingly, small divots would be produced within the energy well in which our universe exists to act as a means by which the spacecraft would be pulled forward. The productions of such vacuum structure divots might also occur in proximate hyperspatial or hyperspatial-temporal dimensions for regions in the hyperdimensions located topologically adjacent to the spacecraft. Thus, it is conceivable that the latter effects can enhanced the spacecraft driving force through ordinary space-time.
